Footnotes:

\*) The determined measurement uncertainty (M.U.) is always given in the same unit as the specified result.

For the calculations of the equivalence sums, the respective acid forms were multiplied by the factor of 0.877 and 0.878, respectively, to infer the equivalent amount of the neutral forms.

Method of Analysis: HPLC (High Performance Liquid Chromatography). Percentages are based on the determined weight of the received sample. All measurement methods were calibrated and controlled with certified reference materials (CRM). The measurements with HPLC were carried out strictly according to the method of the manufacturer, which is certified in the USA (but not in the EU).

This Certificate of Analysis may only be reproduced in its entirety and not in parts.
